Press release INTERZUM 2011

Our technology – your comfort

We have expanded our communication technologies in accordance with the Ecodesign guidelines.

BLUETOOTH

Our hit guide topic!

For our FURNIBUS control system we have developed a Bluetooth adapter which communicates via the standard Bluetooth interface.

Now it is possible to operate our drive systems from a tablet PC or smart phone and so to make use of all the functions.

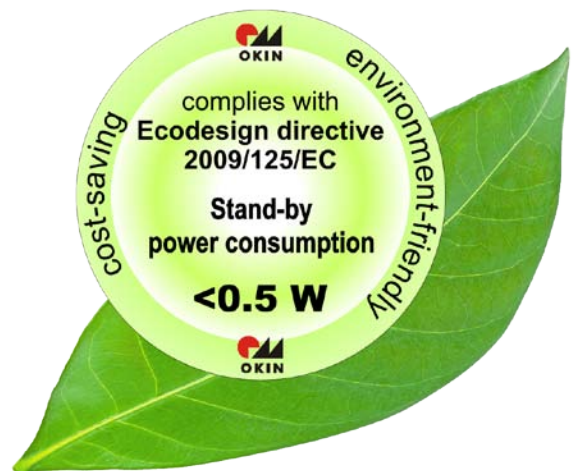

As a special feature, in each case the user interface can be designed to suit your individual needs.

SMPS (Switch Mode Power Supply)

Switch Mode Power Supplies which meet your requirements:

- Thanks to the low power consumption – less than 0.5 Watt in stand-by mode – they meet the Ecodesign guidelines and reduce the costs of energy
- They have a constant output voltage of 29 V DC and adapt automatically to the input voltage of each country
- As an option they are available as a wall plug type (EU, UK, US, AUS, JP) or to accommodate a battery
- We have also optimised the safety features. In addition to a temperature sensor, power monitor, power limiter and primary fuse, we have fitted a thermal fuse which protects the system if one of the other features fails.

Bidirectional radio frequency system

One wireless system, worldwide

You can use our bidirectional radio frequency system (2.4 GHz) anywhere in the world with absolutely no problems. The range is individually adjustable for both transmitter and receiver by means of software.

Approximately 28 million addresses are possible, so there are no problems with parallel operation.

The function LED always informs you if the transmitter and receiver are operating.

The matching manual transmitters can be equipped with any level of operating comfort.

- Individual programmable key setting
- Display
- Massage function, heating
- Floor lighting system and integrated torch
- Memory function
- Soft touch surface
- Customer-specific printing
- Membrane can be illuminated in multiple colours
